

## Report Description

TITLE: Realtime Intertie Scheduling Limits

CONFIDENTIALITY: Public

PURPOSE: This report contains the intertie scheduling limits between Ontario and neighbouring control areas produced by the real time unconstrained run of the algorithm, for each 5 minute interval of the hour.

- Intertie Zones
- Direction of flow from Ontario's perspective. The MW limit in the "to" column represents the Ontario "to" the zone flow limit. The MW limit in the "from" column represents the Ontario "from" the zone flow limit.
- Scheduling limit in MW.

FREQUENCY: Published hourly about 5 to 10 minutes after each hour.

GRANULARITY: 5 minute intervals

NOTES: A value shown in **red** indicates the value is administered due to a tools problem in real-time. In the csv file (and within the xml data) the "N" indicator in the zone name (i.e. MBSIN) refers to the limit in the Ontario "to" the zone flow. The "X" indicator in the zone name (i.e. MBSIX) refers to the limit in the Ontario "from" the zone flow.
